Part of that made it into the piece which will air. A bit more will end up on the web version. The recorded bit was produced before the second half of your answer made it to me.
Thanks again.

Ed-- to elaborate... there are 16 sites in Montana that are listed on the National Priorities List. An additional 2 sites have been proposed for inclusion on the National Priorities List. One of these sites (Mouat Industries) has been partially deleted from the National Priorities List. Most Superfund sites are cleaned up and redeveloped long before final deletion occurs. The vast majority of sites in Montana are large mining districts and/or groundwater contamination sites that require long-term monitoring and attention. A monumental amount of cleanup work has been achieved at these sites, some of which are among the largest contaminated sites in the country. Rivers and streams that had been dead for a century now support fisheries. Communities exposed to contaminated ground water and soil from historic mining practices are now protected from those risks. Contaminated properties have been cleaned up and put back to beneficial use. Parks, trails, and other recreational facilities have been created for public benefit through cleanup and redevelopment.

Ed-- here's a list of sites from our website. I'll check on the "complete" terminology, but each site is very different in terms of the nature of environmental challenges, the extent of cleanup activity that has occurred to date, and requirements for ongoing monitoring, and next steps. Its worth noting that the majority of Superfund sites in Montana are associated with past mining activities that affect large geographic areas and watersheds. While significant progress has been made to address risk and exposure at these sites, they, by their very nature, often require long-term attention. Similarly, many other sites in Montana involve groundwater plumes and contamination that require long-term monitoring and a review of the remedies in place to ensure that human health remains protected.

Turns out I do have 1 question:

CFAC's spokesman says there are 18 superfund sites in Montana, some of which have been Superfund projects since the program's inception 31 years ago. He says no site's (cleanup) has been deemed complete. Is that true?

Rich, how's this for me being a complete pain in your ass? Actually, I think I'm all set for today. I've just been given a hard deadline and am in full scramble mode just to put together what I have. Thank you so much for the opportunity and for putting up with my whining, but things changed just suddenly changed for me. I'd love to talk more in the future about this very topic though. With apologies,
-e

I'll try and get my project lead to give you a call. We're in a bit of a deliberative mode right now so strictly for your information/ hard background would be best. What's your best number?

Ok. Thanks.
Even just a little background interview would help.
You have a good rest of your day.

Ed-- I'd love to help, but I'm coordinating with project staff who are traveling and in meetings today, so I'm most comfortable with statement at this point. I expect we may have some news in the next few weeks, will make sure I share with you directly if and when.

Thanks for the note, Rich.
Think I could give you a call so we could do a quick taped interview? This would make my boss happy.

Ed-- not much affected by the CFAC closure news. The closure of the plant does not change EPA's focus on working with the state, the local community, and the site owners to fully assess the site and take cleanup actions that are necessary to protect human health and the environment.
